

FEDERAL RESERVE statistical release

G.17 (419)

For release at 9:15 a.m. (EDT)
August 15, 2000

INDUSTRIAL PRODUCTION AND CAPACITY UTILIZATION

Industrial production increased 0.4 percent in July. Manufacturing output increased 0.5 percent, and mining output rose 1.7 percent; but with unseasonably mild July weather, electric utility output fell more than 3 percent. At 145.3 percent of its 1992 average, industrial production in July was 5.8 percent higher than in July 1999. Capacity utilization for total industry rose 0.1 percentage point, to 82.3 percent, a level 0.3 percentage point above its 1967–99 average.

Market Groups

The output of consumer goods fell 0.5 percent in July, as the production of consumer durables fell sharply. The production of automotive products dropped 6.6 percent, a decline reflecting a large decrease in motor vehicle assemblies. The output of other durable goods fell 0.6 percent; the sector, particularly household appliances, has been weak over the past several months. During the first half of this year, the output of consumer durable goods was up (over)

INDUSTRIAL PRODUCTION AND CAPACITY UTILIZATION: SUMMARY

4-1/4 percent from a year earlier; with the large drop in July, output was just even with its level of July 1999. Nondurable consumer goods moved up 0.3 percent in July; widespread increases in the production of non-energy products were partially offset by a 2.0 percent drop in the output of energy goods as mild July weather reduced residential sales of electricity.

The production of business equipment rose 1.3 percent, with most groups posting gains. Reflecting the ongoing strength in the output of computers and communications equipment, the index for information processing equipment increased 2.6 percent after a relatively small rise in June; gains in this sector have averaged about 1-3/4 percent per month so far this year. The production of industrial equipment was up noticeably, more than reversing the decline in June, and was 4.6 percent higher than July 1999. With a drop in the production of both autos and light trucks, the output of transit equipment decreased for the third consecutive month. Production of defense and space equipment jumped 2.1 percent in July after an upward-revised 1.5 percent increase in June; gains in the production of guidance and navigation equipment have accounted for much of the recent strength in this sector.

After having declined sharply over the previous two months, the index for construction supplies increased 0.3 percent in July. The output of durable goods materials rose 1.1 percent, with another sizable increase in equipment parts, particularly semiconductors. The production of nondurable goods materials stayed flat and continued the sluggish pattern that has been evident this year. Driven largely by a weather-related decline in electricity generation, the output of energy materials dropped 0.8 percent.

Industry Groups

Manufacturing output advanced 0.5 percent in July, a rise similar to the increases over the past few months. Excluding motor vehicles and parts, the gain in July was 0.9 percent. The production of both durables and nondurables posted strong increases. The 0.6 percent gain in durables was once again led by high-technology equipment and parts; however, the production of motor vehicles and parts plunged 5.5 percent. Iron and steel output fell 0.7 percent and, on balance, has eased over the past few months. The production of nondurables, which was unchanged in June, advanced 0.5 percent. Strong rebounds in production at many industries, most notably petroleum and apparel, along with further increases in rubber and plastics and printing and publishing, accounted for most of the output gain. The overall factory operating rate rose 0.2 percentage point, to 81.6 percent, with small increases in both advanced-processing and primary-processing industries.

Production at mines increased 1.7 percent after having risen 0.9 percent in June. The utilization rate at mines increased to 87.2 percent, a bit below its long-run average. Output at utilities, which dropped 2.5 percent in June, moved down another 3.3 percent in July; the operating rate at utilities fell, to 85.9 percent.

Revision of Industrial Production and Capacity Utilization

In November the Federal Reserve Board will publish a revision to the index of industrial production (IP), the related measures of capacity and capacity utilization, and industrial use of electric power. The updated measures will reflect both the incorporation of newly available, more comprehensive source data typical of annual revisions and, for some series, the introduction of improved compilation methods. The revision will also include a refinement of the method used to aggregate the individual series in the production and capacity indexes. The new source data are for recent years, primarily 1997 through 1999, and the modified methods affect data from 1992 onward.

This statistical release will be redesigned with the release of the revision. More special aggregates will be added, but some detailed industry data will be available only on the Federal Reserve Board's public web site. Additional details regarding the redesign will be provided next month.

This regular updating of source data for IP will include annual data from the following reports of the Bureau of the Census: the 1997 Census of Manufactures, the 1998 Annual Survey of Manufactures, and selected editions of its 1998 and 1999 Current Industrial Reports. Annual data from the U. S. Geological Survey on metallic and nonmetallic minerals (except fuels) for 1998 and 1999 will also be introduced. The updating will also include revisions to the monthly indicator for each industry (either physical product data, production-worker hours, or electric power usage) and revised seasonal factors.

Capacity and capacity utilization will be revised to incorporate preliminary data from the 1999 Survey of Plant Capacity of the Bureau of the Census, which covers manufacturing, along with other new data on capacity from the U.S. Geological Survey, the Department of Energy, and other organizations. The statistics on the industrial use of electric power will incorporate additional information received from utilities for the past few years and will include some data from the 1997 Census of Manufactures and 1998 Annual Survey of Manufactures.

Aggregate industrial production indexes have been built as annually weighted chain-type indexes, beginning with data in 1977; the weights are currently changed at the middle of every year. With the coming revision, the weights will change every month, rather than once a year, beginning with data for 1992.

Once the revision is published, it will also be made available on the Board's web site (<http://www.federalreserve.gov/releases/g17>). The revised data will also be available through the web site of the Department of Commerce. Further information on these revisions is available from the Board's Industrial Output Section (telephone 202-452-3197).

1. The IP proportion data are estimates of the industries' relative contributions to overall IP growth in the following year.

2. Semiconductors include related electronic components.

3. Millions of units at an annual rate.

Note—Primary processing manufacturing includes textile mill products, paper and products, industrial chemicals, synthetic materials, and fertilizers, petroleum products, rubber and plastics products, lumber and products, primary metals, fabricated metals, and stone, clay, and glass products. Advanced processing manufacturing includes foods, tobacco products, apparel products, printing and publishing, chemical products and other agricultural chemicals, leather and products, furniture and fixtures, industrial machinery and equipment, electrical machinery, transportation equipment, instruments, and miscellaneous manufactures.

1. Series begins in 1977.

2. Semiconductors include related electronic components.

Note—Primary processing manufacturing includes textile mill products, paper and products, industrial chemicals, synthetic materials, and fertilizers, petroleum products, rubber and plastic products, lumber and products, primary metals, fabricated metals, and stone, clay, and glass products. Advanced processing manufacturing includes foods, tobacco products, apparel products, printing and publishing, chemical products and other agricultural chemicals, leather and products, furniture and fixtures, industrial machinery and equipment, electrical machinery, transportation equipment, instruments, and miscellaneous manufactures.

Explanatory Note

The statistical release of **Industrial Production and Capacity Utilization** reports measures of output, capacity, and capacity utilization in manufacturing, mining, and the electric and gas utilities industries. The release also includes monthly indexes on the use of electric power in manufacturing and mining. Files containing data in the release and historical data are available under statistical releases at <http://www.federalreserve.gov>, the Board's World Wide Web site. For paid access to these files through the Department of Commerce's Economic Bulletin Board or World Wide Web site, please call STAT-USA at 1-800-STAT-USA or (202) 452-1986. Diskettes containing historical data and the data published in this release are available from the Board of Governors of the Federal Reserve System, Publications Services, (202) 452-3245.

Industrial Production

Coverage. The industrial production (IP) index measures output in the manufacturing, mining, and electric and gas utilities industries; the reference period for the index is 1992. For the period since 1992, the total IP index has been constructed from 267 individual series based on the 1987 Standard Industrial Classification (SIC). These individual series are classified in two ways: (1) market groups (shown in table 1), such as consumer goods, equipment, intermediate products, and materials; and (2) industry groups (shown in tables 2 and 6), such as two-digit SIC industries and major aggregates of these industries—for example, durable and nondurable manufacturing, mining, and utilities.

Market groups. For purposes of analysis, the individual IP series are grouped into final products, intermediate products, and materials. Final products are assumed to be purchased by consumers, businesses, or government for final use. Intermediate products are expected to become inputs in nonindustrial sectors, such as construction, agriculture, and services. Materials are industrial output requiring further processing within the industrial sector. Total products comprise final and intermediate products, and final products are divided into consumer goods and equipment.

Timing. The first estimate of output for a month is published around the 15th of the following month. The estimate is preliminary (denoted by the superscript "p" in tables) and subject to revision in each of the subsequent three months as new source data become available. (Revised estimates are denoted by the superscript "r" in tables.) After the fourth month, indexes are not revised further until the time of an annual revision or a benchmark revision. The last three benchmark revisions were published in 1990, 1985, and 1976.

Source data. In annual or benchmark revisions, the individual IP indexes are constructed from a variety of source data, such as the quinquennial *Censuses of Manufactures and Mineral Industries* and the *Annual Survey of Manufactures*, prepared by the Bureau of the Census; the *Minerals Yearbook*, prepared by the Department of the Interior; and publications of the Department of Energy. On a monthly basis, the individual indexes of industrial production are constructed from two main types of source data: (1) output measured in physical units and (2) data on inputs to the production process, from which output is inferred. Data on physical products, such as tons of steel or barrels of oil, are obtained from private trade associations as well as from government agencies including those listed above; data of this type are used to estimate monthly IP where possible and appropriate. When suitable data on physical product are unavailable, estimates of output are based on either production-worker hours or electric power use by industry. Data on hours worked by production workers are collected in the monthly establishment survey conducted by the Bureau of Labor Statistics. The data on electric power use are described below. The factors used to convert inputs into estimates of production are based on historical relationships between the inputs and the comprehensive data used to benchmark the IP indexes; these factors also may be influenced by technological or cyclical developments. Especially for the first and second estimates for a given month, the available source data are limited and subject to revision.

Weights. In the index, series that measure the output of an individual industry are weighted according to their proportion in the total value-added output of all industries. The industrial production index, which extends back to 1919, is built as an annually weighted chain-type index since 1977. The components of IP are combined using estimates of value added per unit of output. For months from January to June, the weights are drawn from the year containing the month being estimated and the preceding year; for months from July to December, the weights are drawn from the current and following year. The IP proportions shown in column 1 of tables 1A, 2A, and 6 are estimates of the industries' relative contributions to overall growth in the following year. For example, a 1 percent increase in durable goods manufacturing in 1997 would account for an increase in total IP of nearly 1/2 percent.

Seasonal adjustment. Individual series are seasonally adjusted by the X-11 ARIMA method, developed at Statistics Canada. For series based on production-worker hours, the current seasonal factors were estimated with data through October 1998; for other series, the factors were estimated with data through at least June 1998. Series are preadjusted for the effects of holidays or the business cycle where appropriate. For the data since 1977, all seasonally adjusted aggregate indexes are calculated by aggregating the seasonally adjusted indexes of the individual series.

Reliability. The average revision to the *level* of the total IP index, without regard to sign, between the first and the fourth estimates was 0.28 percent during the 1987–97 period. The average revision to the *percent change* in total IP, without regard to sign,

from the first to the fourth estimates was 0.21 percentage point during the 1987–97 period. In most cases (about 83 percent), the direction of change in output indicated by the first estimate for a given month is the same as that shown by the fourth estimate.

Rounding. The published percent changes are calculated from unrounded indexes, and may not be the same as percent changes calculated from the rounded indexes shown in the release.

Capacity Utilization

Definition. Capacity utilization is calculated for the manufacturing, mining, and electric and gas utilities industries. For a given industry, the utilization rate is equal to an output index divided by a capacity index. Output is measured by seasonally adjusted indexes of industrial production. The capacity indexes attempt to capture the concept of sustainable practical capacity, which is defined as the greatest level of output that a plant can maintain within the framework of a realistic work schedule, taking account of normal downtime, and assuming sufficient availability of inputs to operate the machinery and equipment in place. The 76 individual capacity indexes are based on a variety of data, including capacity data measured in physical units compiled by trade associations, surveys of utilization rates and investment, and estimates of growth of the capital input.

Groups. Estimates of capacity and utilization are available for a variety of groups, including primary and advanced processing industries within manufacturing, durable and nondurable manufacturing, total manufacturing, mining, utilities, and total industry. Component industries of the primary and advanced processing groups within manufacturing are listed in the note on tables 2 and 3 of the release.

Weights. Although each utilization rate is the result of dividing an IP series by a corresponding capacity index, aggregate utilization rates are equivalent to combinations of individual utilization rates aggregated with proportions that reflect current capacity levels of output valued in current-period value added per unit of actual output. The implied proportions of individual industry operating rates in the rate for total industry for the most recent year are shown in the first column of table 3.

Perspective. The historical highs and lows in capacity utilization shown in the tables above are specific to each series and did not all occur in the same month. Industrial plants usually operate at capacity utilization rates that are well below 100 percent: none of the broad aggregates has ever reached 100 percent. For total industry and total manufacturing, utilization rates have exceeded 90 percent only in wartime.

Electric Power

Data on electric power (expressed in kilowatt hours) are collected by the Federal Reserve District Banks from electric utilities and also from manufacturing and mining establishments that generate electric power for their own use (cogenerators). The indexes of power use shown in table 9 are sums of kilowatt hours used by an industry or industry group expressed as a percentage of that industry's or group's usage in 1992. The first column of the table shows, for reference, electric power use in billions of kilowatt hours as reported by manufacturing and mining industries in the 1992 censuses of those industries. The supplementary group, "Total, less nuclear nondefense," is shown separately because the value-added proportion for the nondefense nuclear material series (part of SIC 2819) in total IP is considerably smaller than its share of total electric power use. Excluding this component from total power use facilitates comparisons with total IP.

References

The annual revision published on November 30, 1999 is described more completely in the *Federal Reserve Bulletin*, vol.86 (March 2000). The basic methodology used to estimate capacity and utilization is discussed in this article.

A description of the aggregation methods for industrial production and capacity utilization is included in an article in the *Federal Reserve Bulletin*, vol. 83 (February 1997), pp. 67–92. *Industrial Production—1986 Edition* contains a more detailed description of the other methods used to compile the industrial production index, plus a history of its development, a glossary of terms, and a bibliography. To obtain *Industrial Production—1986 Edition* (\$9.00 per copy), write to Board of Governors of the Federal Reserve System, Publications Services, Washington, DC 20551. The major revisions to the IP indexes and capacity utilization since 1990 have been described in the *Federal Reserve Bulletin* (April 1990, June 1990, June 1993, March 1994, January 1995, and January 1996, February 1997, February 1998, January 1999).

Release Schedule for 2000

At 9:15 a.m. on:

January 14, February 15, March 15, April 14, May 15, June 15, July 14, August 15, September 15, October 17, November 15, and December 15
